# 1 Introduction

The objective of this laboratory exercise is to explore the PHP ecosystem and identify an unknown PHP extension that adds a new function to the runtime environment.

A Docker image was provided containing an unknown extension exposing the following function:

```
1 \VoidLabs\canYouSeeMe();
```

The mission is to determine which extension provides this function and to explain the technical steps used to discover it.

## 2 Environment Setup

The container was started using the following command:

```
Last login: Sun Feb 22 14:08:27 on ttys000
➔ ~ docker run --rm --init --name void-lab-php-ext hbahalouane/void-labs-php-ext
```

Figure 1: Starting the Docker container

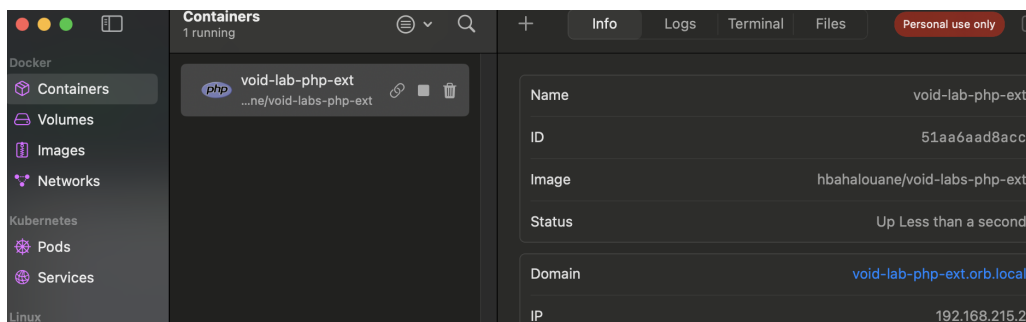

Figure 2: Container running inside OrbStack

Then, an interactive shell was opened and the script was executed:

```
Last login: Sun Feb 22 14:14:35 on ttys000
➔ ~ docker exec -it void-lab-php-ext bash
root@51aa6aad8acc:/usr/src/myapp# php app.php
=====
Hello You!
Find the the extension (.so) path and how it was loaded.=====
```

Figure 3: Execution of app.php inside the container

## 3 Checking if the Function is Internal

To verify whether the function comes from an extension, PHP Reflection was used.

```
root@51aa6aad8acc:/usr/src/myapp# php -r '  
$f="VoidLabs\\canYouSeeMe";  
var_dump(function_exists($f));  
$r=new ReflectionFunction($f);  
echo "internal=" . ($r->isInternal() ? "yes" : "no") . PHP_EOL;  
echo "extension=" . ($r->getExtensionName() ?: "none") . PHP_EOL;  
echo "file=" . var_export($r->getFileName(), true) . PHP_EOL;  
,
```

Figure 4: Command used to check if the function is internal

```
bool(true)  
internal=yes  
extension=sample  
file=false
```

Figure 5: Result of the reflection command

The output indicates that the function is internal and belongs to an extension named **sample**.

## 4 Listing Loaded PHP Modules

All loaded PHP modules were listed using:

```
1 php -m
```

```
PDO  
pdo_sqlite  
Phar  
posix  
random  
readline  
Reflection  
sample  
session  
SimpleXML  
sodium
```

Figure 6: List of loaded PHP modules

The module **sample** appears in the list.

## 5 Locating the Extension File

The extension directory was identified using:

```
[root@51aa6aad8acc:/usr/src/myapp# php -i | grep -i '^extension_dir'
extension_dir => /usr/local/lib/php/extensions/no-debug-non-zts-20220829 => /usr
/local/lib/php/extensions/no-debug-non-zts-20220829
```

Figure 7: Identifying the PHP extension directory

Then its content was listed:

```
[root@51aa6aad8acc:/usr/src/myapp# ls -la /usr/local/lib/php/extensions/no-debug-
non-zts-20220829 | grep sample
-rwxr-xr-x 1 root root 31824 Feb 19 2025 sample.so
```

Figure 8: Presence of sample.so inside the extension directory

This confirms the existence of `sample.so`.

## 6 Finding How the Extension is Loaded

PHP configuration files were displayed using:

```
[root@51aa6aad8acc:/usr/src/myapp# php --ini
Configuration File (php.ini) Path: /usr/local/etc/php
Loaded Configuration File:      (none)
Scan for additional .ini files in: /usr/local/etc/php/conf.d
Additional .ini files parsed:   /usr/local/etc/php/conf.d/docker-php-ext-samp
le.ini,
/usr/local/etc/php/conf.d/docker-php-ext-sodium.ini
```

Figure 9: Displaying PHP configuration files (1)

Then:

```
[root@51aa6aad8acc:/usr/src/myapp# ls -la /usr/local/etc/php/conf.d/
total 8
drwxr-xr-x 1 root root 50 Feb 19 2025 .
drwxr-xr-x 1 root root 12 Feb 4 2025 ..
-rw-r--r-- 1 root root 17 Feb 19 2025 docker-php-ext-sample.ini
-rw-r--r-- 1 root root 17 Feb 4 2025 docker-php-ext-sodium.ini
```

Figure 10: Displaying PHP configuration files (2)

```
[root@51aa6aad8acc:/usr/src/myapp# cat /usr/local/etc/php/conf.d/docker-php-ext-s
ample.ini
extension=sample
```

Figure 11: Configuration file loading the sample extension

The file contains:

```
1 extension=sample
```

```

root@51aa6aad8acc:/usr/src/myapp# grep -R "extension=" -n /usr/local/etc/php/conf.d/
/usr/local/etc/php/conf.d/docker-php-ext-sample.ini:1:extension=sample
/usr/local/etc/php/conf.d/docker-php-ext-sodium.ini:1:extension=sodium
root@51aa6aad8acc:/usr/src/myapp# php --ri sample

sample

Version => 1.0

```

Figure 12: Extension loading verification

- The `grep` command shows which extensions PHP is instructed to load.
- The `php -ri` command displays information about a loaded extension.

## 7 Verifying the Function Inside the Binary

To confirm that the function is compiled inside the extension:

```

root@51aa6aad8acc:/usr/src/myapp# strings /usr/local/lib/php/extensions/no-debug
-non-zts-20220829/sample.so | grep -E "VoidLabs|canYouSeeMe"
VoidLabs\canYouSeeMe

```

Figure 13: Strings output showing `VoidLabs\canYouSeeMe`

This proves that the function is embedded in the binary file.

## 8 Results

The function `\VoidLabs\canYouSeeMe()` is provided by the following PHP extension:

- Name: `sample`
- Binary file: `sample.so`
- Loaded via: `docker-php-ext-sample.ini`

## 9 Bonus: Creating a Similar PHP Extension

To create a similar extension:

1. Generate an extension skeleton using `phpize`
2. Implement the function in C using the Zend API
3. Compile the extension using `make`
4. Install and enable the extension

## 10 Bonus: Why Use PHP Extensions

PHP extensions allow:

- Faster execution using native C code
- Access to system-level libraries
- Implementation of features not possible in pure PHP

## 11 Conclusion

Through systematic inspection using reflection, module listing, configuration analysis, and binary inspection, the unknown function was successfully traced back to the **sample** PHP extension.
